PRODUCT INFORMATION SHEET

Instructions for Using Release Points

Release Points help to keep beneficial insects off the floor and on the plants. For beneficials that are shaken on leaves, the surfaces can be thin or slippery. A Release Point prevents the beneficials from sliding off the plant. For very tall plants, Release Points can be raised on a pole and hung on the plants. The Points can be used for many beneficials including, spider mite predators and thrip predator mites. Release Points come in two colors, white or green. The green Points are harder to see, thus providing camouflage. If you want to find the Points to refill them, you may find the white Points more convenient.

Using Release Points:

1. Decide how many beneficial you want in each Release Point. For example, you have 10 large plants and each plant requires 100 spider mite predators. If the spider mite predators are in a vial of 1000, you would pour 1/10 of the vial in each Release Point. The Points can be divided in any way that suits the plants.
2. Pour the beneficial into the Release Point in the area where it will be hung and place on plants **immediately.** The Points are hung at the leaf petioles (where the branch meets stock) near the infestation sites. Beneficials tend to climb up the plants, thus place beneficials below the pest problems.
3. Release Points can be re-used for many releases of beneficials. Once the beneficial insects have left the Point, the beneficial carrier can be dumped and refilled with new beneficials.
